Russia's attack on Ukraine will lower growth and boost inflation

Dr. Carlos Mejia
Chief Investment
Officer

A handwritten signature in black ink, appearing to read 'Carlos Mejia'.

Our thoughts remain with those hurt by the dreadful conflict still raging, which puts our economic concerns firmly into perspective. Those concerns should perhaps be a little less pressing anyway. The conflict has had less of an impact on the global economy, so far, than it might have done.

Growth may be slowing, but there are no signs yet of the feared recession. Developed economies had momentum going into this geopolitical crisis – not least because of the widespread post-pandemic re-stocking of inventories. In China, the recently-renewed covid-related lockdowns are being eased, promising a rebound in growth there.

Energy costs in real terms are still not as elevated as they appear – real oil prices were higher in 2012 – and even the more extensive shunning of Russian exports by the West might not trigger more dramatic spikes.

Nor are monetary conditions especially tight. If anything, real interest costs and debt burdens have fallen over the last year, even as policy rates have started to rise, as a result of the surge in inflation.

So, talk of “stagflation” still seems premature to us. That said, the investment climate remains riskier. We hope for a peaceful settlement soon, but escalation is also possible even now: rationality may not prevail. And central banks will not allow policy to stay this loose: interest rate expectations have resumed their pre-crisis upward drift.

We had already reduced our equity weightings in the New Year as it became clear that central banks were indeed planning (rather belatedly) to start normalising monetary conditions that had become needlessly lax. We reduced them further on news of the invasion.

However, our equity holdings have returned to neutral only: we still see corporate profitability staying healthy, and valuations, while stretched, are not outlandish. And the funds released have been held as liquid assets.

We did not think the reduction in global risk appetite would be big enough for bonds to rally for long. That said, with some government bond yields in the US recently offering positive real yields to maturity, we are now beginning to reduce our long-standing underweight in bonds there.

Asset allocation summary

July / August 2022

We have cut our double (maximum) overweight in equities to neutral, in two stages: first in early January, and then on February 24th. We have retained a double underweight in bonds, and have instead allocated the funds to cash, where we are now double overweight.

EQUITIES

We cut our overweight firstly to reflect rising interest rate risk, and then on account of the disruption and economic slowdown associated with the conflict in Ukraine (the risk of slower growth has not resulted in a meaningful reduction in interest rate risk). Corporate profitability may not be hit hard, however, and we still see equities as the asset class most likely to preserve real wealth on a long-term view.

FIXED INCOME

We moved maximum underweight in bonds in 2021. Despite the recent rise in yields, and the likely boost to safe-haven demand resulting from the Ukraine crisis, we still see little chance of inflation-beating long-term returns from the asset class in Europe, though we have now begun to reduce our underweight positions in US portfolios. We mostly continue to prefer corporate and emerging markets ahead of core government bonds, and despite flatter yield curves stay underweight in duration.

MONEY MARKET

The prospect of positive real returns is still some way off, but the nominal stability of cash, and the opportunity it provides to take advantage of volatility in stocks (or, eventually, bonds), makes it attractive currently. We do not expect the overweight to last enough to incur much inflation erosion. In US portfolios we have trimmed it to fund the reduced underweight in bonds.

GOLD

Gold has been a long-term store of value for three millennia, though its short-term volatility can be high. Its long-term credibility does not rely on central banks, governments or an internet connection, and its low correlations with traditional investments can provide diversification. Tactically, the boost it may receive from today's inflation is offset for us by the prospect of rising (real) interest rates.

Equities: Regions

SUMMARY

The threat to growth from the Ukraine conflict has led us to reduce our weightings in (Continental) Europe, with the exception of Switzerland, where we have raised them on account of its defensive characteristics. We remain unconvinced by the commodity-intensive UK and emerging markets (ex Asia), but instead expect US leadership to resume, and emerging Asia to regain some poise. Russia, part of the Eastern European emerging market bloc, is now effectively uninvestable for international investors.

North America

Ukraine may have little direct effect here. Re-stocking, together with pent-up consumer demand, seems likely to sustain growth even as fiscal and monetary policy becomes more restrictive. Operational leverage may continue to push expected profitability higher in 2022, even as costs rise.

Japan

Valuations have been attractive, but the trend in improving profitability had faded long before the pandemic arrived. Japan's market traditionally confounds most tactical calls, and its shift to a more conventionally capitalist model is progressing glacially.

Developed Europe ex-UK

We moved back down to underweight: Europe is most closely linked economically to Ukraine and Russia, and its stock markets can be relatively sensitive at times of global cyclical and financial stress.

Pacificex-Japan

Strong commodity prices offer support to the Australian economy, but rising dollar interest rates and ongoing political tensions may restrain Hong Kong. We stay neutral.

United Kingdom

The UK market's high weightings in unpopular and ESG-challenged sectors such as oil and mining have counted against it, but a lot was priced in and as commodity prices revived in 2021, we moved up to neutral. We are not inclined to add further, Ukraine notwithstanding.

EM ex-Asia

Previously dominated by Russia (with its intense geopolitical risk, weak governance and undiversified economy) and Latin America (with governance issues, similarly big commodity weightings and exchange rate volatility). Russia has effectively been removed from the benchmark, but we do not want to chase commodity prices from here: we stay neutral.

Switzerland

Big weightings in healthcare and consumer staples give the Swiss market a defensive orientation: in today's more nervous climate, this is no longer the deterrent that it was and we have reduced our underweight.

EM Asia

China dominates this bloc, and has been badly hit by a mix of regulatory, cyclical, geopolitical and now renewed contagion concerns. It is trading at the lowest relative valuations since China joined the WTO, and in contrast to Russia remains investable (in our opinion). Longer-term, emerging Asia will remain the most dynamic region as global GDP and capital pivot there. We stay overweight.

Equities: Sectors

SUMMARY

We do not yet see a wholesale reversal of last year's market leadership, and have been favouring a mix of cyclical and structural growth, funded by underweight positions in more defensive and bond-like sectors. As a result of the attack on Ukraine, however, we have reduced some cyclical positions and become less underweight on defensives.

Healthcare (US)

Healthcare (EUx)¹

This is the only defensive sector where we have an overweight position, initially in the US and more recently in Europe too. It is not only defensive: healthcare can also offer long-term growth.

Communications (US)

Communications (EUx)

A beneficiary of changes to long-term working practices, but also a target for regulatory concern and higher long-term rates. Not especially sensitive to the conflict. We stay neutral.

Technology (US)

Technology (EUx)

A long duration sector, but one which can also perform cyclically. We reduced our overweight last year as we tilted towards sectors less affected by higher long-term interest rates.

Utilities (US)

Utilities (EUx)

We stay underweight: it is too defensive and bond-sensitive to appeal yet. Most recently: US underweight reduced as counterpart to lower weight in consumer discretionary.

Industrials (US)

Industrials (EUx)

A late cycle cyclical sector that can usually withstand higher interest rates but which is vulnerable to the conflict: we have moved down to neutral.

Financials (US)

Financials (EUx)

We moved overweight US financials in 2021, but have now returned to neutral and move underweight in Europe. Financials benefit from rising interest rates, but are also highly sensitive to market nerves and growth risks.

Materials (US)

Materials (EUx)

Materials face more headwinds than most sectors from ESG considerations in the long-term, but valuations had become compelling and the conflict may favour them for a while: we stay overweight.

Consumer discretionary (US)

Consumer discretionary (EUx)

Cyclical growth prospects have faded with the conflict, most notably in Europe, where the loss of Russian business will be most visible, but now also in the US. We cut the European sector to neutral some months back, and now do the same for the US.

Energy (US)

Energy (EUx)

Valuations have rebounded further for obvious reasons, but we see ESG and structural challenges (such as alternative energy supplies) as still too large for us to change our tactical views.

Consumer staples (US)

Consumer staples (EUx)

Staples' defensiveness is less of a deterrent in the current climate, and it is less likely than others to be hit by sanctions. We have closed a double underweight.

Real estate (US)

Real estate (EUx)

Despite having some cyclical content, the sector often performs as a bond proxy. These are equities, not direct real estate.

¹ EUx = Developed Europe ex-UK

Fixed income

SUMMARY

Despite further increases in yields (and hikes in US and Bank of England policy rates), we stay underweight duration for now. The conflict has not boosted safe-haven appeal as much as it might have done, and inflation and interest rate risk remains significant. Central banks remain further “behind the curve” than they planned to be. We also continue to prefer lower quality investment grade and speculative (or “high yield”) credit to core government bonds: spreads have widened markedly.

High-grade (USD)

High-grade (EUR, CHF)

Ongoing inflation and interest rate risk remain headwinds for core government and high-quality corporate bond markets that are still – even after the further sell-off – expensive.

IG low-grade (USD)

IG low-grade (EUR, CHF)

Support from central bank buying is fading, but corporate cashflow and creditworthiness remain solid for the time being. We do not see recent spread widening continuing.

High Yield (USD)

High Yield (EUR, CHF)

Even in the light of the conflict it feels too soon for corporate fundamentals to deteriorate significantly. Liquidity considerations can be poor in this segment, but for the time being we stay constructive.

Duration

Yield curves have flattened further as more expected increases in policy rates have been priced-in – Ukraine crisis notwithstanding – and this process may not be over. However, there is room for yields to rise across the curve, and it may be too soon to close our underweight call on duration across the big bond markets.

Currencies

SUMMARY

The major exchange rates have remained remarkably stable in the face of the sudden rise in risk: the dollar has firmed a little on some safe-haven demand and rising interest rate expectations, but has not broken out of key trading ranges (in contrast, for example, to bond yields). We stay neutral for now. Longer-term, the dollar will likely remain the biggest reserve currency for the foreseeable future: talk of altered invoicing behaviour will not affect underlying demand and supply. The renminbi cannot challenge the dollar more fully until China's capital controls and structural current account surplus disappear.

US dollar

Often a safe-haven at times of stress, but also a potential beneficiary of a US-led monetary tightening cycle. It is not especially expensive. The Ukraine crisis tilts the odds a little further in its favour, but not decisively so yet.

Euro

We closed our underweight call in 2020 when it became clear that the Franco-German borrowing initiative would support the prospects for the Union and its common currency. It may become vulnerable again on Ukraine nerves.

CHF

The franc's safe haven appeal hasn't been so obvious in recent months, perhaps because it is closer to Ukraine than is the USD.

ROW¹

Expectations for the UK economy outside the EU are likely too low; China's growth prospects and investment appeal may not be under-appreciated.
